I. Title of Project and Principal Investigator

The California Central Coast Research Partnership: Building Relationships, Partnerships and Paradigms for University-Industry Research Collaboration; Susan C. Opava, Ph.D.

II. Summary of Project

The mission of the California Central Coast Research Partnership (C³RP) is to facilitate the exchange of technical knowledge and skills between the higher education sector and the private sector in San Luis Obispo County, and to encourage the growth of high-tech companies in the region, thereby enhancing economic development and quality of life. Since its inception, the project has focused on technologies of relevance to the Department of Defense. The partnership is a long-term plan to create a dynamic and self-supporting university-industry-government partnership that capitalizes on the strengths and mutual interests of the educational and technology-based business sectors. The plan recognizes the key role of higher education in preparing a highly skilled work force and transferring new knowledge to practical uses. The outcomes of this partnership, when fully realized, will be the creation of a robust and self-sustaining base of University R&D activities; the development of existing technology-based businesses and the creation of new ones; and the generation of opportunities for job training and research and development activities for University and Community College students and faculty.

The project also includes the construction (with non-DOD funding) of a technology park on the California Polytechnic State University campus, which will provide state-of-the-art space for private technology companies engaged in research and development activities, as well as a business incubator that will provide all of the support services needed by start-up, technology-based companies.

The aspect of the program supported by the ONR award that this final report addresses is the continued development of a strong base of applied research at Cal Poly. Specifically the award provided infrastructure (equipment and technical support) to enhance and expand research projects supported under other ONR awards to C3RP. The results of those research projects have been or will be provided in the final reports for those awards.

III. Relevance to ONR Objectives

A. Relevant partners.

C³RP represents a coalition of educational institutions, local, state and federal government, and private businesses that have worked together in unprecedented fashion to advance the common goals inherent in the proposed university-industry partnership. The current partners in the project and their contributions include:

California Polytechnic State University

- o committed the land for the technology park project, valued at ~\$1.5 million
- o provided assistance in financial management of the project

- contributed \$90,000 for a pre-feasibility study by Bechtel Corporation for the technology park project
- committed several hundred thousand dollars of in-kind contributions of senior management time and effort over several years and continues to do so
- invested ~\$1,000,000 in efforts to raise additional funds for the project;
 secured sufficient private and other federal funding to construct the first building in the Cal Poly Technology Park

CENIC (Corporation for Educational Network Initiatives in California; association of Internet2 universities in CA)

 works with Cal Poly to provide high-bandwidth internet access to support C³RP research projects

City of San Luis Obispo

in partnership with Cal Poly developed a carrier-neutral fiberoptic ring around the city that benefits both Cal Poly and technology-based businesses

Housing and Urban Development

o provided funds toward construction of the pilot technology park building.

Economic Development Administration

 has provided funds toward construction of the pilot technology park building.

Efforts are ongoing to secure new partners, including:

- Major corporations
- Small technology-based businesses

B. Relevant R&D focus.

The research programs supported by C3RP are relevant to seven of the eight "thrust areas" of ONR's Code 30 Science and Technology Program. The projects projects involve basic research in these areas, as well as applied research and development leading to more immediate technological applications. The seven areas of relevance and the more specific focus areas to which the research contributes are listed below:

Command and Control, Computers, Communication: situational awareness; communications; knowledge management; computational electromagnetics; autonomous systems; LIDAR; data acquisition; satellite constellations; reconnaissance; denial of service attacks.

Force Protection: post-impact/explosive force stability assessment; bio- and chemical-hazard detection and mitigation; risk/vulnerability assessment; new materials; collision avoidance; autonomous robots.

Mine Countermeasures: coastal monitoring; IED detection; situational awareness.

Human Performance, Training and Survivability: cognitive performance enhancement; physical performance enhancement; smart materials; sensors; biological stress reactions; biomarkers; injury repair; improved materials and processes for use on military bases and in the field.

Intelligence, Surveillance and Reconnaissance: data acquisition; sensors; satellite constellations; autonomous vehicles; optical and radar imaging.

Logistics: alternative energy sources; new materials.

Maneuver: advanced design and materials for vehicles (land and water).

C. University-industry-government partnership.

The primary focus of this long-term initiative is to forge a strong link between private sector R&D and University applied research to speed the development of new knowledge and the transfer of technology to the public and private sectors. San Luis Obispo has become a draw for technology businesses (with a heavy concentration of software development companies) from both the LA Basin and Silicon Valley. For example, SRI (Stanford Research Institute), International operates a "software center of excellence" in the city. Lockheed-Martin has a research and development group in nearby Santa Maria. Two local companies manufactured critical components for the Mars rovers, and other companies, e.g. California Fine Wire, Aeromech, and CDM Technologies are suppliers to the military. Also located on the Central Coast are branches of two major biotechnology companies: Promega Biosciences and Santa Cruz Biotechnology.

IV. Summary of Results During the Period of Performance

A. General.

The award reported on here began in December 2004 and ended in December 2009. The majority of the funding was used to develop the research capacity at the University's deep-water pier in Avila Beach, CA. Minor support was also provided to the research program in industrial technology and for remodeling of space to accommodate a center for usability, design, testing and evaluation.

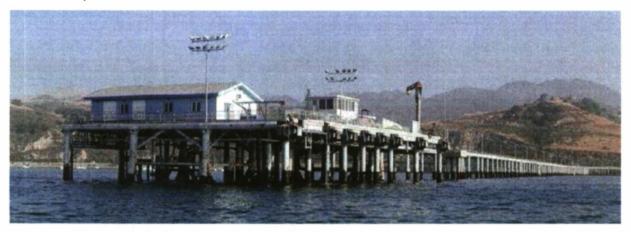

B. Development of new research capacity: specific projects supported.

1. Flowing seawater system for the Cal Poly pier.

One of the goals of the C³RP program is to increase the capacity of the organization to carry out state-of-the-art research in the areas of interest outlined above. One of the most productive research groups in this regard is the Marine Science Group at Cal Poly. While the deep-water pier acquired as a gift from Unocal in 2001 is a unique resource for oceanographic and marine

biological research, it was not a research-capable facility when acquired by the University. In partnership with the University, and with matching funds from other sources such as the National Science Foundation, the C³RP program upgraded the research capacity at the pier through the installation of a flowing sea-water system.

The upgrade developed a seawater-pumping system to elevate water from the Avila Bay to the Pier deck. The system includes an intake system with pumps, a filtering system and finally a distribution network with seawater tanks for marine life observation, experimentation and development. The structural parts included a new concrete slab to lay out filters and water tanks (and to protect the pier steel structure from salted water runoffs) and a simplified building structure above deck to house and protect the equipment and tanks from direct sun and UV exposure. Some funding was also directed toward continued maintenance of the system during the award period. Responsibility for continued maintenance has been assumed by the University. Technical-support personnel were also partially funded to provide assistance to research projects. The pier is pictured below showing structures that support the new seawater system, research laboratories, and classrooms.

Cal Poly Pier at Avila Beach and the Cal Poly Center for Coastal Marine Science (CCMS).

The Cal Poly Pier today is used by students and faculty of Cal Poly for marine science research. Much of this research is supported by ONR, both through funding to C³RP and through other grants and contracts from ONR and other State and Federal agencies. The sea-water system has expanded the research opportunities at the pier and enabled the researchers to undertake more projects of interest to ONR. It has also allowed them to leverage this investment to obtain funding from other sponsors, in addition to ONR. A list of the C³RP-supported projects undertaken by researchers in the Marine Science Group follows. A list of all relevant grants and contracts awarded to these researchers since January 1, 2005 is attached.

C³RP -supported research projects undertaken by researchers in the Marine Science Group:

Adams, Nikki

Biological Sciences

Molecular sensors and defenses against ultraviolet radiation

Bensky, Tom

Physics

High resolution laser-based sea-floor monitoring at Avila Bay Real-time underwater optical sensing of seawater at Avila Bay

Clark, Christopher

Computer Science

Multi-AUV path optimization for improved ocean model forecasting

Griffith, Elizabeth

Physics

Measuring ocean surface velocity and improving estimates of coastal surface currents in San Luis Bay, with application to other bays and coastlines

Moline, Mark A

Biological Sciences

Access to the Central Coast's marine environment through a real-time/archived data interface

Rosenberg, Lou; Moline, Mark

Mechanical Engineering

Enhanced operator control of remotely operated vehicles

Tomanek, Lars

Biological Sciences

Environmental proteomics: The minimal stress proteome in the marine model organisms Ciona

intestinalis and C. savignyi - networks of co-expressed proteins

Environmental Proteomics: A new approach to tracking environmental change in marine

organisms

Wendt, Dean

Biological Sciences

Establishment of a field site for testing non-toxic, fouling -release marine coatings to aid in the control of biofouling.

Related grant and contract awards to researchers in the Marine Science Group (1/1/05-3/3/10) (see Attachment 1).

2. Equipment to support research in packaging and polymers

The packaging laboratory in the Industrial Technology department at Cal Poly has been supported through the C³RP program and is part of the Radio Frequency Identification (RFID) research initiative led by PolyGAIT, the University's center for research on Global Automatic Identification Technologies. The laboratory's state-of-the-art research in packaging (durability, biodegradability, smart materials, electronic tracking, etc.) addresses the important military area of logistics and the transport of materials, mitigation of the cost of waste disposal related to these materials, and protection of foods and medicines that are provided to military personnel around

the globe. A particular strength of the packaging laboratory is the use of novel polymers in various applications, even beyond packaging. One C³RP-supported project has resulted in the development of a new design for a polymer-based oral airway device. A non-provisional patent application has been filed with the USPTO and a continuation-in-part of that application is anticipated. Funding under this award was utilized to further develop the research capability of the packaging group by investing in a compression test unit and extruder as summarized below.

- Compression tester. This device measures compression effects from stacking packaged items during warehousing and transshipment.
- Extruder for plastic resin applications. This extruding device enables sheet and film casting of both petrochemical and biodegradable starch-based polymers.

A list of the C³RP-supported projects undertaken by researchers in the packaging group follows. A list of all relevant grants and contracts awarded to these researchers since January 1, 2005 is attached.

C³RP-supported research projects undertaken by researchers in the packaging group:

Vorst, Keith

Industrial Technology

Development of an emergency oral airway device

Adaptation of the Bardo Airway to the Intraoral Mask: Innovative airway management devices working in concert

Related grant and contract awards to researchers in the packaging group (1/1/05-3/3/10) (see Attachment 2).

3. Center for Usability, Design, Testing, and Evaluation

Partial support was provided for the remodeling of space in the Orfalea College of Business to serve as a center for usability, design, testing and evaluation of products. The center provides the capacity to do advanced development of products that emerge from campus research, by providing essential data on usability and performance. The center also serves the important role of training students in the product-development process and supports cross-collaboration among faculty and students in technical disciplines and those in business disciplines, which can accelerate the transfer of research results to the public. The center is available to all C³RP researchers to assist them in development and improvement of products ranging from software to new technical devices.
